

The EASIEST Way To Build Your Mobile App In 30 Minutes (No Code)

<https://www.youtube.com/watch?v=kqzAaESkNdo>

today I'm going to teach you the easiest way to build a mobile app in less than minutes and get it inside of the iOS or Android store without coding at all in fact we're only going to be using one no code drag and drop tool to build this and by the end of this video I guarantee you'll be able to build your own mobile app from scratch welcome back to the studio everyone at this point you're probably wondering which platform I'm about to talk about so let me introduce you to Dominique Sebastian and Jerome and these three founders are from a small island called Corsica that's between France and Italy and years ago they got together to build what is today one of the leading no code Platforms in the market now the name of this platform is good Barber and it's probably the simplest no code tool for you to launch a mobile app and no good Barber doesn't give you a haircut I'm so sorry in advance for all my terrible dad jokes we got a lot to cover so let's build an app so when you come to their website we're going to see that they're heavily focused on mobile app building so anything that you can launch in the iOS or Android store for example now the two things they focus on are really Simplicity of use but also having pretty powerful apps and you'll see exactly what I'm talking about when we jump in the editor and just the moment but with this platform you can build simple and also complex apps so basically you can build things like e-commerce you could have membership apps where you charge subscriptions and any one of the additional apps here I'll show you the process from start to finish in a sec now one thing I'd like to note here is that it's not just about building the app this also allows you to manage the marketing of the app it also allows you to get statistics of the app inside of this app builder and also monetization so for example if you're selling things online you'll have access to obviously all of the orders and uh be able to fulfill on those so things like Inventory management for example another cool thing is that they have lots of plugins they have more than different plugins and you can also tap into third party apis for more complex features so yeah with no further Ado let's jump in and click on create an app the first thing it does it brings me to this onboarding which is very simple to follow so even if you have no experience you're going to be able to build with this platform now some of you might just be building an app for yourself but others might be wanting to generate their first ,000 online by building a first app for a local business for example so let's go ahead and grab one of these templates to kick it off here we have restaurants that could be a good idea online courses that's also pretty cool local delivery and pickup let's check this one out yeah so why don't we just follow this template we will build a platform that allows you to order flowers and pick them up at the store and you can build this customize it and sell it to your local flower shop so the next thing is choose your theme so I'm going to go with this now you have to choose your overall navigation right so you could choose uh for every time you open the menu for it to open on the left let's grab this one and basically make a classic app where you have the icons at the bottom here I'm going to call my app flower power I'm give it my email address and it's magically doing stuff my app is ready

let's go ahead and Discover it let's jump in now the first thing you'll notice here is that this is actually the functional app right you can click on these and you can actually see what this looks like and you can add it to carts you can go and check out the different sections so we have a section around plants bouquets dried flowers and uh this is pretty much the home now we want to fully adapt this template and we want to build our own version the first thing I would do if you're working within a template is to go and check out the app style here on the right hand side I can change the colors or the color palette let's say that I wanted it to be a little bit more in this color excellent let's go ahead and apply this palette I can also choose for specific sections now in this case I'm just going to change the general palette if I come back here I can then change the font let's say I'm not a big fan of this font it's find of font that's a little bit more adapted to what I like yeah I like that it looks a little bit more like your local spot now of course I can adapt for example the different sections so here it has all the different sections and we could have different fonts for each or the same font for all of them those are some of the basic options that I would definitely change but you have many more under here you could change the actual icons what those look like so that's just kind of the general styling right but if I go up here to the top you can actually change the design of the menu or you can change the layout of the home for example so there's uh a lot that can be done here as well so here it's showing me the structure right it shows the first section which is this promo Banner which has the discount I could choose to delete this if I wanted to let's say that I wanted to just delete it I want to go straight into the flowers for example a wonderful Mother's day then we have some links social media and of course all these sections I could basically delete I could also add all sorts of sections so I could have a list of product something for people to subscribe to my newsletter I could even import custom code down here and once I'm happy with the structure I can also change what each one of these section kind of looks like if I want to change the display here I could have it look more like this where it shows individual ones I could have it be sliders so you have quite a bit of flexibility in terms of how you want this thing to look in my case I kind of like like the one that we had originally so let me keep that one and you can do that through all the sections before we get too lost in the design if I come back to the main panel I see here on the right hand side there is a little thing called structure so this basically shows you the entire structure of the app that homepage might click to different sections the bottom you have a navigation so here we're going to be able to check all of those things out you can either look at it as a tree which is kind of simpler so there's a header and then we go to the menu bar the menu bar can direct you to all of these different ones right so there are basically a list page and and then there is a detail page for each one of those plants this is where we're going to have all of the items and we're basically going to replace these with the items of our actual local flower shop the most important thing to get first is this structure so you can obviously adapt these existing sections but you could also for example add a section from scratch you could create different collections so this would be basically like different items so we have plants we have bouquet we have dried flowers collections are not the only thing we can put here we can also have all sorts of other things like a Blog we could have a form we could have map even connected my own YouTube API and brought in all of the videos that I currently have in here so if I wanted to I could literally just create an app for we no code it would notify people every time a video was released and even have some interactions with my fans through this mobile app by the way if you have an idea but you have no idea how to code and you don't even know how to get started but you don't want to spend

\$30,000 on expensive programmers you can check out our course below that allow you to build launch and monetize your startup without writing a single line of code we have a free course but we also have a full course bundle that breaks down every single step and also provides you with workbooks so that you don't have to guess anymore so you can follow the steps to build launch and monetize your first app you will also get access to a community of more than 10,000 people who are also doing this crazy thing called entrepreneurship we still got lost to cover so let's jump back into the building if you go all the way to the bottom you even have extension store now this is where it gets exciting and you can actually build in some deeper functionalities inside of your app for example if I wanted to integrate a payment Gateway I could easily do it let's say I don't want people only to pick up these flowers I can also deliver them and you could pretty much connect this to anything because they also have this developer tool here are some of the popular ones here below so for example in store pickup stock management but if you want to just check out all the ones that are available you can go here to all categories you pretty much get the point now let's get back to our app now once I'm happy with the kind of layout and structure of the app I'm going to want to replace all of the actual content because I don't have these poetic pompas in my store I have I don't know red roses so here we go into structure we're going to be able to edit the content for each one of these sections I can go to Plants it's going to ask me if I want to edit the content or edit the design you can edit the design of this entire sort of block or the product list but let's go ahead and edit the content so this is where we're going to add all of the inventory that we actually have pH dendrum okay didn't even know that was a thing go ahead and delete those or I can actually import an entire list of items even with the number in stock so that once we don't have any more stock there are no more available to purchase of of course we can create individual ones by clicking on this button then we're going to need to add that to a collection add tags if we want we're going to show how we want to kind of display it so now let's say we fine-tune this app to the point at which it has all of the information we want it has the design that we like it has the structure that we like we've added all the functionalities that we want and now we want to actually start preparing to launch this right now before we're ready to start launching I would recommend that we go and update the launch screen so this is basically the screen that we're going to use once we open up the app here you can either write out and text or or you can add a picture I would actually recommend to get a high quality design in here that would look really beautiful when people open app it's kind of a little wow factor and up here you can also check out how it's going to look on iPhone and Android once I'm done with that I will jump into the next section which is the app icon you might want to get a designer to do this for you but you could also do this right here and create kind of a basic design once we're ready to launch the next step is going to be to come here to dashboard and to actually start preparing for that launch we get to choose between launching in the iOS store the Android store or to create a progressive web app so let's say wanted to publish to the iOS store go ahead and publish in iOS now what I love about this is that they actually have a full checklist and you have to basically comply with all these things before you can push it in but it really makes it easy for you to actually go and fulfill these so if I wanted to come here I hadn't done the icon yet I could do that at any point you can jump in here and you can check out by previewing your app you can in fact even have a test mode of your app once you've configured your store here what it'll allow you to do is basically to create a QR code that you can send to anyone and just by checking out that QR code they'll be able to access your app

here inside of the settings you can go ahead and add uh essentially your emails if you want to send out emails to your clients push notifications now if you wanted to sell this app to the store you could actually give them access to this platform because here they're going to be able to check out all of their orders they can also manage all of the products you can teach them how to do that to hand it off and they're going to have a whole list of the clients that they have so this is a CRM to here is also the statistics of the app so really checking out the activity the traffic okay so everything you've just learned in this video should allow you to build your own first app from scratch but building an app is different than actually going out there and getting paid customers so if you want to check out this video I'm going to show you how not only to build a full AI app from scratch but also how to go out and get paying customers for it video is just hanging out right here so why don't you just click on it and check it out if you like that video then subscribe to the channel I'll see you guys in the next video
