

8 Websites You Won't Be Able To Live Without!

<https://www.youtube.com/watch?v=jw-7BzXlxc4>

- I've scoured the web to find the best, most game-changing tools for creators and entrepreneurs, and some of them will blow your mind. Imagine building a website in under seconds, or using your voice to type in any app at lightning speed. What about a tool that turns your computer actions into step-by-step guides and videos automatically? And there's even a platform with text and audio summaries of over million podcasts, plus so much more. Coming in at number one, this one's called Durable.

With Durable, you're able to create a website in under seconds. Here's an example of a website I built in seconds for a hypothetical coaching business. You can see that it's created a hero image, all the sections of the website, and much more. All that's needed to be done is to use its AI to get started, enter your business that you're building.

Let's say coaching, click on Next, choose your location, click on Next, enter your business name, hit Generate Website, and let Durable complete the rest for you. And now your website's ready. You can customise every aspect of your website right here, choosing the colours, fonts, buttons, choosing other styles, creating different widgets, or you can regenerate the website if you don't like what you see. And the best part is all this can be done without learning a line of code. Right away, if you wanna start editing, let's say the headline, click once, this form will appear, and simply edit away.

You can change the colour palette of your website by simply going to Customise, go to Colours, choose from one of the combinations in the palette. Let's say this one right here. And in an instant, it's changed the look and feel of your website. Now get this, AI can also assist you in terms of content and regenerating images.

Let's say you wanna rewrite this section right here. Click once, and then you can regenerate using AI. Or if you wanna replace this image with another image, click that image, and then regenerate to a different image. Add a new section to your website by looking for Add Section. Click that once, and then choose from one of the sections on the list.

Once you're ready to publish your website, all you need to do is hit that Publish Website button, which does require a paid plan. However, I've hooked you up with a 30% off for three months on any Durable plan. Simply use the coupon code AURELIUS30 in the coupon field to check out and save. So go ahead, build your website using Durable, and have your website up and running by the end of today. Next up on the list, we've got Pika. Pika is a text-to-video AI tool that can generate videos just like what you're seeing right here.

And some of these examples, which they call Pika effects. So you can do things like blow things up, melt things, crush things, inflate things. Here's another example with a big screenshot effect. Another one with different moves.

Here are a number of other examples here. This one's of a rubber duck getting crushed. A longboard races downhill on a winding road. Bullet time shot, camera circling around the floating furniture.

So these are all pretty cool effects that I don't think any other text-to-video AI generator can actually produce. All you need to do is describe your story in the text prompt here. You can click on Pika effect and then choose from one of the effects if you wish to do so. And you're given credits to start with and play around with Pika. I mean, what it can produce is quite stunning already.

And we are anticipating the launch of OpenAI Sora, which has yet to be released to the public. But I think many of these text-to-video tools are quite overtaking, you know, Sora already. Okay, coming in at number three, this one's called PodSnap. It gives you key highlights and summaries of your favourite podcasts or over million podcasts. So you can save time and never miss on anything from your favourite podcast. So as an example, here's a summary of the episode "Dopamine Mindset & Drive" by the Huberman Lab.

There's an audio summary right here with a text summary too. So as you can see, if you don't have two hours to spare, you can get the gist of it before actually diving into the podcast and seeing, you know, should I be spending two hours on this or should I get the gist of it and then learn more when I have time. On the backend, you simply follow the podcast that you wanna follow. Let's say Minutes, click that. You can see what it's about. Click on follow this podcast.

And then once you've clicked that, it goes into your followed podcast where then you'll be given real-time alerts and summaries when a new episode is out on that podcast. With so many new podcasts on the rise and information out there, but with very little time, this is the least we can do to get the gist of our favourite podcast. Okay, number four is Chat LLM by Abacus. This tool combines many of the chat bots and AI systems all in one so that you don't need multiple subscriptions, which, you know, ChatGPT charges at least \$20 per month for just to use some of the latest models. And I've heard that this monthly fee will only increase over time.

So if you're looking for an all-in-one platform that combines Chat GPT, Claude, Gemini, and other generative AI tools all in one, then this is the go-to. It works just like Chat GPT. You can select the model from the list right here. You can see the supported models. There's the text prompt right here.

So you would chat just as you normally would. You can upload an image, some code. There's a playground, some screenshots they can add or generate some PowerPoints. You can also do these other things.

This one's of a simple article generation on this topic right here. There's a document generator as well. Here, we've got a text-to-image generator using Flux. And all this can be accessed for as little as \$10 per user.

As I said, ChatGPT alone are charging \$20 per month. So go ahead, check out Abacus's Chat LLM. All right, the fifth tool is called Dubble. Dubble allows you to create documentations based on actions on your computer. So you can simply do the actions that you normally would and then Dubble will record every single step including screenshots, a description of each of the actions.

And in addition, it will create a tutorial video just like this. So this one's an example of how to make a website under seconds using Durable. And don't get mixed up with Durable and Dubble. Durable was the first tool I talked about where you can create a website in less

than seconds.

And Dubble's created the screenshots, the steps, it's created the descriptions and the actions that need to be taken all neatly on one page, which I can then share with my team members, anyone who I'm collaborating with or simply anyone who wants an explanation on what it is they need to do. Dubble's really easy to use. All you need to do is instal the Chrome extension and then on the toolbar, all you need to do is click on the Dubble icon and then start recording. And once you've started recording, all you need to do is do the actions that you normally would on your computer to show how a particular software works, how to create a new document or whatnot.

And then once that's done, click on Stop and then it will create and generate that document for you automatically. Next up on the list, we've got a tool called MyLens and they've got a specific feature that allows you to enter a YouTube URL and then you can summarise it based on the purpose. You've got other tools that can summarise YouTube videos but this one in particular gives you commands and prompts that are pre-made. You can summarise the key insights, create actionable takeaways, weaknesses and reasoning. You can also do some of these other things like critical evaluation based on, of course, the video that you paste in here.

So let's take this for a spin. Head to YouTube, go to the video that you want to get a summary of. We'll click on this right here, click on Share, grab the URL, go back, paste and let's go and do something simple and get key quotes from this particular video. I want the complexity to be intermediate so moderate detail with explanations and then click on Go. And in a matter of seconds, it's generated this visual mind map where I can see what this video is about.

It's given me these key quotes. We can see the three, four rules, no more than three to four words, no more than three to four elements used as a guideline. Bear in mind though, this is on a free plan so it's only given me 25% input usage. If you do upgrade to its pro plan, you will be given more details in terms of what it's shown on display. Then what you can do from this is to click on Download and it will save it as an image.

That's a useful tool whether you're researching, planning for work or for school. Use this to summarise any YouTube video. All right, next up, you're gonna love this app, especially if you hate typing. This one's called Flow. It allows you to speak to write.

It doesn't matter what app you're on, all you need to do is hit that Control button, whatever command or shortcut that you've set. Let's say we're on Google Docs. I'm gonna activate that shortcut right now and then start speaking. This is a demo of Flow so you can see how it works and I'm using this so that we can use our voice to convert it to texts more easily instead of typing. And as you can see within an instant, it has entered the text and even cleaned it up for me. I intentionally added the ums and those filler words and it's cleaned it up for me, obviously didn't add it in.

And this can be used on any app, any website, wherever there's a text box. Let's say you're replying to someone, you can simply hit that Control button, whatever shortcut that you've added and then talk away on your mic. So instead of suffering from writer's block, why not use Flow to simply free flow and not make any mistakes while you're actually going away, creating content or whatever it is that you're creating or responding to. Okay, this last and final

tool is called Tabs Magic. And as the name suggests, it has to do with tabs, more specifically Chrome tabs.

You know, when you have dozens and dozens of tabs open, it's really hard to manage and find that specific website that you saw, let's say last week or the other day, gets lost in the sea of tabs. So rather than suffering from that, why not instal Tabs Magic, which is again, a Google Chrome extension. And once you've done that, all your tabs can be organised into columns just like the following. So I've got all of these windows open according to what I'm doing for today's video. I can open all of the tabs all at once by clicking on open all, or go to a specific website by clicking on any of the specific windows.

You can create different categories, let's say for news, which I've got Forbes and Entrepreneur. And you can create a new folder by clicking this. And let's say you're simply doing some research and you've got windows and tabs open based on research. Let's say this window here that's currently open, simply drag and drop it to research.

And now I've got that organised under research. I've also got a couple more articles that I wanna put on the research. So simply drag it right here, drag it again for these ones. And if I wanna open all of these three all at once, click that once, and there we go.

This is one of the articles, this is another, and this is the first website that was on the list. So if you're like me who has dozens of tabs opened and drowning in the sea of windows, why not use tabs magic to organise and make your life easier? And there we go, friends, eight useful tools to give a try today. Let me know in the comments which of these intrigued you or which ones you see yourself using on a day-to-day basis.

I'd love to know. In the meantime, watch this one here or this one here to learn more useful tools you can implement to your work and life, make yourself more productive.
