

# AI Video Editing - Top 5 Tools We Recommend in 2024!

<https://www.youtube.com/watch?v=QkI7U0LCvJ8>

AI video editing tools are seriously evolving fast so in this video we're going to share the best AI tools for video editing that we recommend right now so that you can create videos in a fraction of the time has been really tough to narrow this down to just five top apps right now but app number one is Descript this is one that I have been a massive fan of for a long time and they really changed the game as far as making editing really really simple by allowing you to edit your videos from text so yes this concept was around for a long time but it was Descript that really made this easy and accessible and it's actually evolved now to be this amazing content creation machine it's actually what I'm using right now to record this video I'm recording directly into Descript and this is how we make all of our YouTube videos and even course related content for our accelerator program it's all done in Descript but in terms of AI functionality and why we love this so much yes it's going to automatically transcribe your videos or your audios so that you can edit it as if you were editing a Word document but it's also got amazing functionality to make your audio sound so much better by enhancing the vocals by removing background noise their AI Studio sound feature is awesome there's also AI tools to help you edit faster as well with one click you can remove all of the gaps all of the silence area you can easily remove any pauses any filler words like UMR or so and there's even a new feature now which will let you automatically remove any double UPS or any retakes and it will help you pick the best one for that this is something that's helped us speed up our editing so much because I'm someone who tends to make a lot of mistakes when I'm recording you can also train Descript to learn your voice as well so if you do need to make any minor changes or fix any mistakes that happened at the time of recording you can literally just type out what you want and it will say it back in your words in your voice and there's even now an eye adjustment tool so if you're someone who is reading from a script maybe you're looking off to the side or below your camera it'll automatically move your eyes back so that it looks like you're making eye contact with your viewers now when I first saw this it was a little freaky a little strange but well done it looks awesome now obviously there's so much more in here and you can use this for podcasts for video creation for so much stuff and we do have a full breakdown of reviews and tutorials and things which I will link in the description box below but in terms of our workflow I love that we also have the ability to export from Descript into other programs like Da Vinci Resolve where we can then take our editing to the next level with more PR grade tools too now in terms of pricing there's a few different options there is a free plan where you can jump in and have a play around there's also a trial of some of the more Pro level features as well but beyond free there's where you can jump on the hobbyist plan for \$12 per month I'm currently looking at annual billing so is a little bit more if you just want month to month or there's a Create plan here for \$24 a month which this is the plan that we use unlocking 4K video capabilities and pretty much all of the AI features now there is also one other plan above that the business plan for \$40 per month billed annually which it says gives you unlimited access to full professional AI suite and it gives you more transcription hours and more minutes of AI generated speech per month as well tool number two is CapCut this is

another one that we talk about a lot on this channel and it really packs a punch in terms of all the AI functionality that's in there it's probably the most advanced AI wise video editing tool out there right now now this is an app that works on desktop so there's a Mac version there is a Windows version and there's also an IOS and Android version as well but there is also a webbased version which does unlock some different AI tools as well but I find the best use of this is on the mobile or on the desktop versions of this app so cap cut does have some of the same features that descript does in terms of letting you edit from text and removing filler words and removing silence it's not as good as descript but still awesome that it's in here as well it's also got the ability like descript to automatically add in captions and text for your videos as well but some of the standout AI features for me in here are things like Relight so if we come over here to relight let's enable this we can see this is going to let us add essentially lights to our scene here and adjust the lighting after this video has already been shot and you can see it's taking into context where there are people in the shot so you can see it's adjusting the light there on my face but also applying it to the background area as well so in this case we've added a warm light we can also add cool lights so you can see these subtle differences we're able to easily make really really quickly and easily and obviously we can dial this in further we can change the color of those lights we can change the intensity the radius the distance there's a lot of customization in here there's also things like an image enhancer built in there is AI expansion as well so if we enable this now and let's maybe we scale this down a little bit and now let's choose edit expanded area and then go ahead and generate here for us and it's going ahead and expanded our shot here for us and look it's done a pretty good job obviously we can regenerate we can make adjustments to this but I mean that's pretty good just like dript there's built-in voice enhancers in here as well to make you sound better to remove background noise there's also the ability to translate your video into other languages as well and it does sync your lip movements to try and match those other languages and what you're saying in the other languages as well another standout for me is the AI color correction so this auto adjust tool here this does a really good job of making color correction easy this is normally something that I would advise people not to use is the auto adjustment tools but this one does a really good job now obviously again there's so much more in here that I'm not covering off these are some of the standout features for me and again we got more links in the description to help you dive in further with this now in terms of pricing there is an amazing free version of cap cut but a lot of those AI functions are only in the pro version right now which you can access for around \$8 per month the next tool is an amazing AI plugin for Adobe Premiere Pro and it's called autocut so obviously for this one you will need to be using using Adobe premiere Pro and this is an add-on to it but it's got a bunch of really amazing really useful AI functions that it then adds to Premier so you can see here it says that automate manual editing tasks and Save hours so it has the ability to help you add captions into your videos so it's automatically going to transcribe your videos and add that text easily to your screen just like descript and cap cut you can automatically remove the silencers and any quiet pieces as well but the standout features for me with this and where I think this is really really powerful is the podcast editing where it will analyze the different speakers that you might have in your podcast or in your video and it's automatically going to edit that down for you and it's essentially going to choose your camera angles based on who it is that's speaking and it does this so fast this one feature if you're editing podcast or long form interviews is going to save you so much time and it's also got the ability to automatically zoom in or essentially create

jump cuts for you in and amongst those Transitions and edits automatically for you as well there's also an amazing Auto B-roll feature here as well after it's transcribed your video it knows what's happening in there and this will help you go and Source stock footage B-roll clips that you can then easily bring into your project as well this is another massive time-saving feature that is pretty awesome now in terms of pricing there is a free trial available so you can jump in and you can check this out and you actually don't need to even enter a credit card to do the trial version but then up from that they do have a basic plan which is pretty basic you can see there's not much unlocked on that but that starts at \$660 per month billed annually but really the AI plan here is where the magic happens at \$14.

per month billed annually this is where pretty much everything gets unlocked the next AI video editing tool is Opus clip and this is another one that I'm a massive fan of these guys have really been the leader in the space for AI repurposing of content so essentially you can upload a video and their AI will go through and analyze that content and help you pull out what it thinks will be trending or viral or engaging pieces of content from that longer form content and it does this so well we've tried so many of these tools but we keep coming back to Opus Clips because it seems to find the best clips and it's only kept getting better and better since it first came out so even on their website here one long video viral Clips create times faster pretty simple promise but it's also so much more than just helping you find these clips from within your longer videos now these Snippets it's actually going through and analyzing your entire video and it will automatically edit some of these clips and pull different pieces from different sections of your video to create something engaging but it's crazy how well this works it easily helps you add all the text on screen to make your video engaging it'll automatically reframe your shot for you to keep the content piece or the most engaging piece in frame and it will even now help you create something even more engaging by automatically adding in b-roll as well so it's going to help you find additional footage to help you create something that was different from what you first created or the video that you're repurposing it's really helping you create a standard alone piece of content instead of just a snippet that's been chopped out of a longer form piece so you don't just have to use this for repurposing or just creating shorts or Tik Tok style content you can now actually use this to create widescreen or Square videos as well and you have the ability just to do this automatically where you let it decide and it goes and finds all the clips or you can actually jump in and you can adjust a lot of this stuff to really dial everything in and almost like manually edit things in here as well and there's also a bunch of templates in here that you can customize up or even create and save your own templates in here if you want to have a consistent theme or look to your videos and in terms of pricing there is a free version which is great if you want to jump in have a play around it does have a watermark so you will want to jump on the starter or Pro Plan to remove that and to unlock all of the features but if you want to unlock everything and really get the full experience of Opus clip that's where you want to be on the Pro Plan which is currently even cheaper than the startup plan at \$14.

us per month again billed annually and got to keep saying it there's so much more in here and with all the tools than what I'm currently showing you so that brings us then to Tool number five which is Runway ml which is another Beast of a platform that does so much stuff but it all really revolves around AI but the big difference with this one is it's more generative AI so this is where we can ask AI to create a stuff that has never existed before or to create a video from an image so in terms of video creation or making b-roll from nothing this tool is

phenomenal you can literally just type out what you want this thing to create and it's going to make it out of nothing so at the time of filming this gen Alpha is their latest release on this video generation software or Ai and they got some amazing examples on their page here that you can go and check out of things that have been created either from an image or from a text prompt and these look so real so they've even got a section on the website here photorealistic humans and just have a look at how real these are I mean these are scary real and we can see the prompt here that was given an astronaut walking between Stone buildings a middle-aged sad bulb man becomes happy as a wig of curly hair and sunglasses Falls suddenly on his head I mean that's pretty specific but I mean how awesome does this look how real does this look and we actually did another video where we compared this to some of the other tools out there like this so again I'll have that Linked In the description box below so just scrolling through the tools that they have on here obviously we've got the generative video which is what I'm most pumped on in here they've got generative audio as well where we can generate audio from text it's got lip sync in here as well so you can upload your audio and an image and it's going to synchronize the two for you so it's going to make people's lips move which is just crazy there's background removal there's text to image text to video there's all sorts of stuff in here I say like there is so much but the standout feature for me with this is the generative video up the top here it's just crazy how awesome this is And in regards to pricing there is a basic free plan says here it's free forever where you can jump in you can test this stuff out if you're doing videos in here there is a limit of 720p for the quality of those videos but to enhance that that's where you can jump on the standard plan which does up to 4K videos and gives you longer video times and more Generations per month or up to the Pro or unlimited plans here to unlock all the features and functionality so those are my top AI video editing tools right now I am excited to see where this goes already the changes from the last time we made this video to this video are huge and it's changing fast so let me know down in the comments which is your favorite tool whether it was one of these or whether you're geeking out on something that I didn't mention this video let me know as always we' got a bunch of other resources and tools in the description box below to help you even further along with some reviews and tutorials on some of these tools that we just mentioned as well and I will see you in the next video
