7 No-Code + AI Tools That Can Make You RICH

these seven no code AI tools have the potential to make you rich if you know how to use them this is Jesus and after learning just one of these tools he was able to scale to $120,000 in his first year so buckle up my friends cuz I'm about to show you how you can turn simple designs into full-on Apps create striking presentations in seconds with AI and even turn your voice into action so this first tool I want to introduce you to pretty much broke the internet when it was first launched specifically and the designer and developer Community why well because it's actually a really big step forward for the UI ux world the name of this to my friends is VZ and it was created by versel and it's a platform that allows you to build fully functional UI ux elements or web design without writing a single line of code so it's fully prompt based which means that you can build components or entire projects without having to be a designer or developer so let's jump in here and the first thing that you'll notice is that it's pretty much just set up as a chat so you can come in here and you can kind of just describe what you would like it to build so let's start with something simple like build me the landing page for a website that's similar to Airbnb I'll probably add have a search function and showcase some properties so you see it's actually coding this as we speak and in a second right now you're going to see the preview of what it's actually coding and what you just saw was actually in real time it generated this entire thing but it still has some errors I can see that here the four stars for example it's kind of strange and it's used some placeholder data but it's pretty much displaying a lot of things that I'd be looking for here so let's go ahead and make this full screen where are you going Paris what are your dates we're going to leave tomorrow when are you coming back until when I guess guests uh three guests let's go ahead and search so this is pretty impressive for just that little prompt if I click here view details it's not actually working so let me go ahead and close this and let's just create some additional stuff so here on the left hand side I can actually continue to converse with it and I can continue to fix bugs to add things to ask for additional things to tweak some of the things I don't like here so let's see what it can give us now please add detail Pages behind the featured properties with all the information someone would need to rent a property and so it tells me here that it's actually created a detail page that you can view by clicking on view details let's check this out holy smokes look at that it even has on the right hand side it's sticky has a location has all these different things and then it even showcases other properties and I didn't even ask for anything I could ask for it to change all the smaller details inside of this actual app but I'm actually pretty Blown Away with what it's created just off the bat and remember that it's actually built all of the code behind this so This is actually something that you could download you could also copy all of this code and at the top right here you can also just share so these are all functional uiux pages that you could send to a developer who could then connect it to the back end and the product at the moment is in beta it's completely free it obviously allows you to also upgrade the plans start at $20 a month and so this is already super impressive but what I'm about to show you is probably going to completely blow your mind because with this next tool we can take it even one step further now this tool is called Buzzy and I've already talked about it on

the channel however they just released this incredible plugin that got my head spinning you see Buzzy is actually one of the first platforms that allows you to build full apps with prompts and let me show you what their new plug-in can do okay so I'm inside figma here which is an amazing design tool that I highly recommend and as you can see I've built out the design for an app here so I have all of the screens for this app if I come here to the bottom and I grab all of these I can basically come to the plugins come here inside and Buzzy has this plugin so here it finds the screens and it asks me if I want to create an app and so I'm going to create a new Buzzy app now I've created a brief here that kind of describes the app as you can see I'm going to go ahead and auto mark up so this is a workout app called flexifit where I'm going to be able to essentially track my workouts and track my meals I'm going to go ahead and click continue now what is doing is that it's actually identifying all of the things that are on these screens to figure out where it actually has to put functionality behind it it tells me it's going to be about minutes but last time I did it it actually took a lot less time and just like that it took about a minute and a half and we have screens are marked up excellent and then we're going to come here and we're going to click on publish I'm actually going to go straight here and I'm going to go to view in live mode and my friends it has just created a functional app just from designs inside of figma which is absolutely insane so let's go ahead and check this out first thing I'll do is go ahead and add a workout so I'm going to go ahead and add the name of the workout I can have a date where this happened and select this date so as you can see it's actually functional so this is a fully fledged app here that we're talking about and now I have that I can go back here to the main app and then underneath your recent workouts I'm going to see chess I didn't put an image so you don't see anything here for meals I can also go click on meals it's going to add a meal let's go ahead and select this was lunch two eggs and as you can see here if I go a bit further down then it's going to show me my lunch was at 1:26 so this is actually really cool it's built out of first version of my app it's very impressive again this is the beginning of this kind of movement right I have a lot more to share with you and yes all the tools I'm talking about you can check out in the description below and actually go ahead and play around on your own but let's say you don't want to build an app what if you just want create crazy AI automation that's highly catered to your business well that's what we're going to get into with this next tool and by the way the deal between me and you is that if you're impressed by any one of these tools you have to click on the Subscribe button yes it's the deal it's just me alone here Jesus look at how sad I even have to Pat myself on the back this my friends is Vector shift a company that recently graduated from Y combinator and that just raised millions of dollars in funding there are no code AI automations platform which makes it really easy to create workflows that have ai and you can use this in really large organiz but also in small ones Christian what are you talking about well they have this Dragon drop Builder that allows you to actually build these out and then you can deploy them as a for example search engine as an assistant as a chat bot or actually create automations and if right now you're thinking Christian I can do this with Chad GPT well this is incredibly more precise let me explain so imagine just for example connecting your Google Drive that has a million documents in it that are not at all organized it can basically search through those documents and find what you're looking for incredibly precisely and they do this with two key features one is an advanced document analysis the other one is basically this hybrid model so usually you search via keywords here you can do it through keywords but also blend in meaning so for example you could upload the drive file where you have 10,000 pictures from

Hawaii and ask it to find that one where you were wearing that beautiful necklace with no further Ado let's jump in let me show you how it works when you jump into the platform everything here is based on pipelines which are basically workflows now the first thing that you're going to want to do is to input a knowledge base right so for example here if I click here I'm going to be able to add a new one in this case I'm probably going to choose to connect my Google Drive so I'll click on create new knowledge base and then I'm going to call it agreements do something with contract for this one I'm going to turn on the advanced document analysis and the hybrid model that I just explained now I'm going to upload any documents that I would want it to be able to get access to here I'm going to add an integration with Google Drive then I'm going to select the document here which is going to be the sales for May going to go ahead and confirm the selection and once I have my knowledge uploaded I'm going to be able to come here in pipelines and I'm just going to show you how the Builder works it's super simple create a new one you can actually use a template but here I'm going to use from scratch input grab this drop it output grab this drop it then here I'm going to want to use an llm I'm going to use open AI I'm also going to add the knowledge base so let's go ahead and grab the knowledge put it here in this case I'm going to use a chat box so here for the input it's already text so yeah I'm going it's going to be a a written chat bot and here for the knowledge base I'm just going to select the agreements rep it the knowledge you want it to have over here I'm going to select which uh actual version I want to use I'll use the latest one so preview question because that's what um we're going to be feeding it up here in the input field and then I'm going to put context which is going to be the knowledge base it's going to create these two little nodes here and then I'm going to connect them so here the input is going to be the question and here the results are going to be based on this context right this is the context we're feeding it in here then we're going to connect this one here then I'm going to connect this one here and that's pretty much it let's see this in action we're going to go ahead and deploy changes then we're going to click export as a chat box we going to call it agreements and now I'm just going to query the data what was my best sales day in May so my top day was actually the 4th of May so that's pretty much it the platform is super flexible so you can build all sorts of AI automations with it okay so if you have an idea for an app but you have no idea how to get started and you don't have technical skills then check out we are no code we help people build launch and monetize their software businesses we have cheap options like our course bundle below or one-on-one coaching and we even take on select customers for custom builds so instead of just staying in analysis paralysis with that awesome idea take action today let's get back to the video this my friends is an awesome no code Builder called No Loco now in a previous video I showed you guys how this tool can just take a simple spreadsheet and basically with AI generate a full app app but now I want to present to you their new AI workflows cuz they've blown me away now first of all no Loco is an awesome tool to be able to build internal tools like client portals crms dashboards Etc and you can build these with their database but also connected to an external database like air table or Google Sheets not impressed yet come check this out here I'm inside of a client portal that basically allows you to manage everything in your company so here projects tasks clients basically all of it and one of the biggest problems when you run a business is to basically create these custom proposals for each one of your clients so I'm not going to show you how you can actually automate this inside of your app to do that I'm going to come here inside of workflows now workflows is basically like an automation right something triggers it and then

it's going to run through a bunch of different actions okay to save you some time let me just show you the finished product basically when someone action updates record for that specific project then what it's going to do is it's going to create an action which is generate proposal right so here it's one of the steps which is an AI workflow step which is send a question instruction to chat GPT and here I put a prompt you are an expert project manager at a design agency so I give it a role I give it a goal and then I give it a specific set of instructions and then at the end I want it to be very specific to a client so I put the client name I put some information about the client which are the notes and then I added the call notes as well and then I needed to update that record too but let's see this thing in action I'm now inside of my portal and if I come here to the right on the top there are proposals now here I can create a new proposal as I had mentioned I can give it a description right so here I'm actually going to pop the transcript right inside of here of a customer conversation that took place then I'm going to come here and choose the actual client we're going to say it's elite event planning and then I'm going to go ahead and just save that as you can see my proposal is now generating leveraging AI because the workflow in the background actually saw the trigger and it's starting to create the proposal and voila about seconds later here I can see the full proposal the overview of The Proposal understanding of your needs proposed solution timeline budget estimate why us and then the next steps and this is just one of many AI workflows that you can now do that can run in the background of all of your apps inside of no Loco which is so cool but let's take this one step further my friends now let's say that we want to make a really beautiful presentation with this but we don't necessarily want to have to send this to a designer and do all the steps this is where this next tool will absolutely shine but for that I'm going to have to copy this entire proposal this next tool turns any prompt into a beautiful website in seconds and after being launched in they quickly raised millions of dollars for it the name of the tool is GMA and let me show you how we're going to leverage it to close that deal if you come to the website they show you that it is a new medium for presenting ideas and you're going to see their AI is pretty badass and once you're inside the ease of use is so amazing so I'm going to go ahead and create a new AI presentation here go ahead and generate this one is using AI so you can create presentations websites or documents here I'm going to create a presentation right so let's go ahead and do that describe what you are making please turn this posal into a customer presentation then I'm going to come here I'm going to copy this let's see what it comes up with it says eight total cards that sounds good then I'm going to go ahead and select the sort of template that I want to use here on the right hand side kind of like this one looks kind of futuristic let's go ahead and use that can go to the top here and I can basically click generate let's see what it comes up with just like that it's just generating everything leveraging AI this is really cool our presentation is finished let's see let's go ahead and come to the top here and see what we have since it's an event planner seems like it's uh decided to choose the event planner picture so this is the first slide and it's about us key features and functionalities so ultimately we might want to just edit this so first of all you can select from a bunch of different pictures you can also choose to just completely search from scratch uh so you could create instead of luxury event planning you could have slick app development cuz I think that's a little bit more what we're providing to them so let's go ahead and uh generate that's a little bit more like it let's go ahead and go a bit further down let's go ahead and click on that there's obviously some way better options here let's choose this one and just like that in a couple seconds we have this presentation that we could pretty much

send to the customer so now you can download this as a PDF you could upload it inside of no Loco to the customer's profile and you could also create another AI workflow that creates a personalized email to each customer that you could add with this presentation inside of it by the way if any of these have impressed you you owe me a subscribe and if not keep watching cuz I'm going to continue blowing your mind here let's jump into the next tool this is Claude a competitor to chat GPT boring content Christian I already know CLA well I bet you didn't know this you can turn a picture or a napkin sketch into a website leveraging this tool so to show you this I came to my website we are no code.

com we're going to scroll down and I'm going to find a section that I'm trying to actually recreate so here I'm going to create the uh free resources section where we have a free course the YouTube channel and a tool repository let me just take a picture of this section here I'm going to air drop it to myself I'm now going to go back to Cloud I'm going to feed it this image and I'm also going to add this specific prompt turn this image into a website and just like that it's created all of the HTML and the CSS behind that picture based on that design let's go and see what it looks like preview okay it has the three sections free course YouTube channel tool repository start learning so it's basically uh done all the visual recognition it's transformed that into to code and now let's say I need a little more spacing in between these and it is now rewriting this go ahead and check it out just like that now let's go ahead and publish it click here copy the link boom just like that we have the version that works so yeah there are lots of hidden tools behind tools you might already think that you know now remember Jesus from the beginning of this video who made 120k his first year using this tool well the name of the tool that he used is this one it's called Glide it's a no code app builder recently inside of their Builder they've released some AI tools that are are really cool including things like voice to text so let me show you this tool and explain how you can have it trigger actions when you jump inside the Builder you can go ahead and create a new app now the cool thing here is that you can generate an app from scratch leveraging AI so let's just start with that create a Notes app that uses audio to text notes recordings that sounds good let's go ahead and create this app so this is the editor if I go ahead and create a new recording it's going to have all of these different fields so I'm going to first of all come inside of data I'm going to create an additional field here we're going to call this field record then I'm going to come here inside of the field type we're going to go to AI I'm going to choose audio to text and I'm going to come here and I'm going to add a field we're going to create a field which is um recording we're going to create a basic URL field this is where I'm going to store the recording itself and we're going to create another one which is called voice note and now here AI Fields audio to text then I'm going to go ahead and click on that field the URL is going to fall there go ahead and bring these over here now I'm going to go into the layout I'm going to add a component here audio recorder go ahead and add it so I'm going to delete all the fields I added a recorder now I'm going to add an audio now this audio is going to come from recording I'm also going to add a little title so let's have a text entry and now let's quickly test this out hello 2 is this working my name is Christian boom and it's going to be right here hello two is this working it is working and the way to make this into actions is that as soon as something falls into a data field we can have that be a trigger we can create automations behind it and we can literally have it do things like send that to to slack for example now your next question is probably how do you generate money with these skills Christian well each one of these skills is actually something that many people will be happy to pay for so Jus for

example chose to get good at a no code app builder and builds apps for people you could choose to do things like sell client portals with no Loco sell presentations with GMA or even automate the systems inside of other businesses become a freelancer for front-end development with things like vzer or create apps with Buzzy and if you want to learn how not just to use these tools but actually how to build a profitable SAS business then check out this video because I'm going to be showing you every single step that I use to build an AI app and actually go out and get customers for it hope you got value from this video check out this one let's go
