6 No-Code AI Tools I Use To Make $30,000+/Month

if I was stuck on a deserted island with a laptop and an internet connection here are the six no code and AI tools that I would bring with me in fact these are the tools that I use every single day to generate more than $30,000 a month for my business but before I get into them let's find a little bit of shade here in the studio that's better now before you ask Sil questions like how did you get all this material to your deserted island or why is there even Wi-Fi on deserted island let me just remind you the last person who asked that many questions ended up on a deserted island of their own okay I really have to stop with these dad jokes now for each one of these tools I'm going to be telling you how I use the tool why I selected this specific tool and I'll also be giving you alternatives to this tool so that you can figure out your own perfect stack okay so this first tool it's a tool that allows you to build websites and web apps without having any technical skills at all I would consider it the spear that I use to go out and Hunt because feeding yourself is probably the most important thing on deserted island and so this tool is called softer it allows you to build landing pages websites and full web apps without writing a single line of code and because one of the biggest benefits of no code is building quickly I selected this tool and I use it very often specifically for landing pages when I need to whip something together that looks really good if you come to their website they promise to build custom apps for your business fast and this Builder connects to any database that you'd like to connect to so if you have data for example inside Google Sheets you would be able to connect that information and represent it on a beautiful user experience on the front end and the other cool thing they created was an AI app builder so you can basically just input a prompt and you can create simple business apps leveraging this tool as well and recently we used software to build out ofie which is an AI podcast research assistant now one of the downsides of this platform is that you can't build very complex API calls or workflows but they're shipping so many more features every single day and so they're basically becoming more and more complex and if you're looking for an alternative to this tool I'd have you check out Glide which is another pretty cool platform also quite simple to use but let me remind you that sofware is a front-end Builder so the next tool that I'm going to be giving you is basically the database that I use every single day to do all sorts of things from building out internal processes automations and also use it as the back end or the database for startups now the platform is called air table and I absolutely swear by it the best way to describe air table is that is basically an Excel but on crack and it lives in the cloud and it used to really only be focused on the data side of things but now it's creating all sorts of interfaces and you can do things like have advanced scripting which means you can add code and so it's becoming more and more powerful in terms of what you can actually do so for example I've built out a full CRM leveraging air table for my sales team and so if I'm going to be stuck on an island and I need to earn a helicopter to come and fly and come get me I can definitely trust air table is going to give me some power to be able to generate some cash now if I was on a deserted island the next tool would be my rope allowing me to build incredibly useful things like a raft maybe or potentially shelter and it's a tool that I use every single day in my business again called make

now make is a no code automation tool and allows us to automate certain tasks for example if someone filled out a form with their information we could send that to our email marketing tool but we could also use it for more complex scenarios for example bringing AI into one of our apps but basically it's about shooting information from one app to another and connecting those and so yeah we've used make for example to build that platform I told you about outer view where we actually go and do a lot of the research leveraging make scenarios where it actually Taps into AI goes searches the web brings back information now I can't even tell you the number of different things that I use this platform for But ultimately it probably saves me about hours of work every single day by the way all the tools that I'm mentioning here you can find below inside the description of this video and these three tools I just talked about are very powerful specifically together however if I'm trying to build complex software I need to move to a no code tool that I'm going to be talking about right now let me introduce you my friends to Bubble this platform was used to create some of the biggest success stories in the no code space it allows you to really build with a visual drag and drop interface the more complex software tools that you might want to build it's what call a full stack Builder meaning that there's pretty much everything inside of one platform now of course because it is so complex it also comes with a deeper learning curve but you can pretty much become a full stack programmer once you've learned how to build things with bubble now if you're looking for an alternative to Bubble I would probably say you should check out flut orlow that being said Bubble is still quite a bit ahead of them and very recently they released something which made everyone very excited you see up until now you could only really build web applications but now you can build mobile apps that you can have inside of the IOS and Android storeage too so if you check out their website more than 3.

million apps have been built leveraging this platform $15 billion raised from Bubble users people who have built with this platform and teams are using this all over the place so it really is a proven platform at this point and if I need to build complex software then I would definitely turn to Bubble to build a very solid and scalable version of the product up until now we've only really been talking about building things out that being said what people love much more than functional is be beautiful right so this next tool that I'm going to be talking about is one of the tools that I would use to put a beautiful Finishing Touch on all of the projects that I built out this my friends is figma a design tool that allows you to create awesome graphic designs but it can also help you convert actual web designs and build those out from scratch think of this a little bit like Photoshop but way easier to work with in fact this platform was one of the first ones where someone created a plugin that allowed you to use Ai and you could just describe and it would build out an app for you personally I use figma for creating all sorts of things from all of the assets that I need for my social media marketing I also use it for any designs for landing pages and as you can see as soon as you get to their website they are quite focused on actual web design now there's so many different plugins and tools that you can use to convert figma files into fully built out products for example there's a no code tool called Bravo Studio that you can actually push your figma designs into and it creates an app from them I can bring you into my account here and I can show you some of the landing page designs that we've done we'll also use it for all sorts of social media posts like carousels on Linked In it really is a beautiful design tool that you can use and build beautiful things with and I would definitely bring this tool to a deserted island cuz guess what if you just add a little bit of design to a nice app it makes it look a thousand times better and that can be the big difference

between software that people actually use and software that people actually love now the next tool I'll be talking about is the one and only pure AI tool that would bring with me I gave this a lot of thought it wasn't easy at all but ultimately it would be chat GPT my reasons for that is because you can do all sorts of things and also the speed of innovation at which they have released new features I obviously use Chad GPT for simple things like asking it questions coming up with good ideas but I've realized lately that it is a lot more powerful than that especially with the latest version that's being released and the minis that have being released and also the ability to build out full-on gpts that you can then integrate to your projects I think the chap GPT has just a wide variety of things so instead of choosing Claude for the copyrighting cuz I think it sounds a little more human then uh perplexity for research I would really just bucket it all under one and of course remember that I only have six tools that I can bring to this deserted island by the way Chad GPT would also be my Wilson I would be able to chat with him all day long and just have a good time you know what I'm saying my friends if you gave me three more spots for tools I could bring to this island there are present to you they are no code AI tools that I absolutely absolutely love and they are getting better and better every day the first one my friends is reloom it's an awesome platform to be able to help you speed up the process of building and designing websites you can basically come in here you can type in the name of your company and it's going to create a full site map in just a couple of seconds let me show you what I mean I can just click on generate just like that it creates all the sections of the homepage it also recommends other Pages here I'm using the example of my company we are noode we basically teach people how to launch their startups with no code and so here I'm going to add a courses section and then from here you can push it and Export it either to figma or to webflow to actually have it build out this entire thing of course this is a paid tool it's very powerful AI that's going to be super useful for you to integrate and so I love this tool bonus tool number two allows you to have anything that you have in your head be created as a design as a web app or a website the name of the tool is Galileo once I'm here select create a mobile app so let's just say an analytics platform for LinkedIn creators generate and just like that in a couple seconds it has the profile it has full post analytics follower analytics and then the cool thing is that I can adapt any one of these screens and I can also extract the code and I can push it to figma as well to design on top of them so I love this tool now this next tool is called relevance.

and it is a fascinating platform maybe one of the best platforms that I've seen to create AI Workforce and workflows and agents it's a low code platform meaning that you can do a lot without coding but then sometimes you can have a little bit of code in it as well well so you basically train an AI to do specific tasks for you now I won't go too too deep into this tool because it's a bonus tool but what's awesome is that it will get better and better because you can tap into existing llms like chat GPT for example now all these no code and AI tools are absolutely amazing but the most important thing is for you to focus in on the ones that are most valuable for you and if you don't believe it's possible to build million-dollar businesses leveraging no code and AI tools and check out this video because I break down five success stories in the no code space that are going to completely blow your mind hope you like this video subscribe to the channel so you don't miss out on any awesome videos I release now please send me a raft or Rescue Team to get me off this island immediately
