From Screenshot to Landing Page in 18 minutes using AI

thanks to AI anybody can create a landing page now just say some words and you'll get out a highly converting landing page whether you want to do it for your personal site like a Linkin bio or you have a product or an app that you're trying to sell these will convert very well you can do it now with AI you don't need to hire someone super expensive landing page expert and you don't need to pay a bunch of money for a template and so in this video I'm going to be building a landing page for the app that we're releasing in within the next to days and so we're going to go through this whole process right now and in this process you're going to learn these four things how to make a landing page that is simple and converts into Dollars why you should make a landing page for your company or personal site how to use mid journey to make the assets and the logo to make it look super clean and number four you will learn how to use the best tools for easily deploying web apps so you can start building other more complex apps that involve chat gbt or CLA let's just dive straight into it we're going to go to v0 dodev now I want a landing page for my app that I'm building same style as the images I will attach make it look the same but with info about my app and I'm just going to paste right here info about the app that I'm creating which is called Yap through red right here okay so this is a pretty good uh landing page right here we're just going to screenshot this right here and we are going to go like this let's go like all right so we just downloaded four Images right there we are going to run this and so v0 is thinking and now it says here is a react component now it's starting to generate the code and here it goes and so here it is so here is the landing page right here Yap thread transforming ideas into content effortlessly your AI powered creative companion let's see how this compares to this so we obviously don't have an image right here it has this before image after image and so I'm just going to say please match the colors and Vibe with this site and I'm just going to attach that image again right we're going to iterate a little bit I don't think it did an amazing job with the style but that's a good start and it has the right language from my from the apps documents so I'm just going to include this right here and let's see how it edits it oh no way it's generating uh this image right here almost um and it's kind of just making its own version of it right here I have so many ideas for Content but I don't know where to start no worries let's capture our thoughts and organize the no way so like I want this thing right here put that next to the main hero text to the right of it and wow this is actually looking pretty good can you make the buttons have thicker borders and make the borders dark gray and be creative with the styling between each section of this site keep all else same and yeah so that should be good let's run that so this tool is called v0 and basically it allows you to use nextjs and you can actually immediately share these with a V v.

d domain o this is looking good so far the hard part about using this is like you can't really set it up to your own domain directly on this site but I have created this free template and basically hooked this up to your own domain let's see if let's see how this works here and look at that so we have this right here I think these buttons look a lot better now so this is starting to look really good but there is just one thing that I want to make sure we fix so notice how if we were looking at like an iPad view right here or even skinnier this is not basically changing so

we want to add um a break point I believe that's what it's called when the phone goes to iPad view or phone view can you please move the image of the text example down so it's not crammed you can literally just say that and that will literally be enough okay it is done let's go ahead and test this all right there we go so now when it goes to this phone view like this is kind of what the user will see on their phone and that looks pretty good and obviously we don't have those images in there yet but we will and so what I want to do right now is before we put this into the next tool for deployment let's go ahead and create the image assets here and so what I'm going to do here is can you take that green color and and the red color and all the other colors on this page and make a simple image showing the color palette of this page simple image showing the color palette of Yap thread and here it is and so here is the color palette I've actually never done that before that is actually really cool what I want to do is I'm going to grab this right here I'm just going to grab this long image right here and now we're going to open up uh mid journey and I'm going to bring in that image right here so we're going to bring in that image and drag it in right there and here we are going to say uh Simple app icon cute character cute speaking character thick gray border and let's just generate a ton of these right here on Mid journey I forgot to generate these in square we're looking for an icon here run a few more of these you know what I really like this one so I'm going to make sure that we heart this I feel like this might actually be good we can just call this Yap thread and so now we're going to take this into canva and we're going to hit this background remover perfect it did it perfectly we can make this 540x and let's go ahead and make it a PNG with a transparent background and we can download this and so now that image is downloaded so once you have your generation on v0 and and your things are looking good and you have your logo you can now come to this link right here which will be below the video which should take you directly to this template link and this is a very simple replate link that I believe you should be able to use for free so we're going to use this template link and we're just going to call this Yap thread um landing and we're going to Fork this now what we're going to do is we're going to come back to V and what we're going to do is we're going to copy this add to code base so there's these this little add to code base button we're just going to hit copy this and now what we're going to do is we are going to go to this landing page and then we're also going to open up the shell and the first thing that we're going to do is go to Shell so we're going to go to Shell and we're actually just going to paste in that thing we copied from v0 so we're going to paste this in and we're just going to press y here we're just basically it says okay to proceed we're going to press Y and then what we're going to do here it's going to load a little bit and it's basically just installing everything everything that we need here and we're just going to press y uh Y and here we go new patch version available updated to files workspace and what we should see here is we should actually see see this new landing page so it automatically added this new landing page and so what you're going to do is you're just going to take this little landing page right here you're going to drag this up into the app folder and you're just going to delete the page.

TSX that exists already so we're going to delete this delete this file and we're going to rename this to page. TSX now what we're going to do is I just added a new uh page. TSX please make sure it works properly as a landing page uh generate the full code for any changes that are needed and we're just going to run this directly in repits this is the first AI chat that we are running and so it is taking a look here here's the updated app page. TSX with um the files let me make sure that this is what we want Yap threads so it should look exactly

like this when we are done and so we are in coming back over here so what we're going to do is we're going to copy this and we're going to go page.

TSX we're just going to paste that in just like that and let's go ahead and run this and let's see if this works and there we go now we have that same same web app right there but remember that logo we just created watch this we're going to go up to this public folder and then we're going to open up this image folder so here is that image PNG file and so I'm just going to drag it into that image folder and I'm going to rename this right here here it is I'm going to rename this to logo. png this logo. png file can easily be changed so this logo. PNG file now needs to be referenced so I want it to show up in this header bar right to the left of Yap thread so I just need to tell AI that so at the bottom of this thread we can actually create a new AI thread and say right neck thread in the top bar I want the logo to be there and I'm going to say the public slash images folder called logo.

png uh generate the full code for page TSX which is the this landing page component right here uh generate full entire code okay that's done generating so once again let's just copy this and we're going to go to page. TSX and we'll paste that in like that and boom boom there it is the logo is super clean right there at the top and here we have this landing page and we can add in other images as well and so I actually grabbed Microsoft Apple Nvidia and uh Marboro and so in the images folder I'm going to add a new folder and I'm going to call this companies and we are going to drag in these four Images here into this company's folder and I'm going to go back to the AI for the uh trusted by section please use the we can paste in the names for them so here we are pasting in these images right here maror Apple Nvidia and Microsoft uh please use these for images generate the full code generate full entire code for uh page.

TSX boom okay now that that's done we're just going to copy it and let's go ahead and paste this in and let's see if this looks different okay these didn't make it in and we can actually see here it's referencing it through the images folder but it needs to be images SL comp folder so watch watch this if we type in companies here SL Marboro this marbor one should show up and it does so then we're just going to copy this and we'll do the same thing for all of them and it should all show up so here is the site that we're going to try to deploy so here we have Yap thread we created this so quickly in like minutes and trusted by Innovative content creators how Yap thread Works pricing and we have this Yap thread down at the bottom and look at that so here we are able to come up to the top and we can just click deployments and let's go ahead and hit this right here approve and deploy and then we'll go over how you set it up to your own domain and there we go it's successfully deployed and now we can we're going to go to settings on deployment down here and we're going to hit link a domain and I'm going to change this to Yap buddy I'm already have a uh landing page for Yap thread but I also bought Yap buddy.

com which is actually in contention I don't know if we're going to name it Yap thread or Yap buddy one of the two and um we can hit next and what we need to do is we need to go to wherever you bought the domain so I bought it from name cheep and we can click on Yap buddy and so we're just going to hit manage and we're also going to hit Advan DNS and we are going to delete these records host records so we're going to delete this and we're going to delete this and we're going to hit add new record and we're going to do an a record and we're going to make the host at and the value is going to be this value from repet so we're going to

paste that in right there and we're going to hit the check mark now we're going to hit add new record um we're going to go down to text record at and then we're going to copy this right here and we're going to paste this in and now we have officially connected our site now we're going to hit link domain and this is going to take a little bit we changed it to Yap buddy and there you go we have created this clean website added our own custom logo we could have easily and as soon as this done so this takes a little bit of time to verify because right now if we clicked y buddy it's going to say your connection is not private and here it is right now it still says Yap thread because that's what I deployed it on then I made the changes so in order for that to be update I would actually need to if you want to update it again you just need to go to deployments and what you need to do is you actually need to um and you need to press this right here it says redeploy and once it redeploys then it should be updated with your latest landing page um code okay so one thing I really really want want to include in this actually is the ability to add in um information submission so if someone comes to your app you want them to be able to put in their name maybe you want them to join your wait list maybe you just want their email to sign them up for uh some sort of email list that type of thing gathering information is one of the smartest things you can do as a business owner and that's one of the primary objectives of a landing page is you want to capture information the easiest and cheapest it's free uh way to get that information is to go to tally .

o and once you go to T. O you can basically just create this with a template very quickly and once you've created your um form you're going to go to the share Tab and within this share tab um I like to turn off this align content to the left it brings it in just a little bit like this you can do full page um popup which is on the bottom right let's hit get the code and so we're just going to copy this code right here and what we're going to do is we're going to go back to our web app right here we're going to go to Ai and we're going to open up a new chat and say generate full code for page. TSX include this um embed of the of a tally form to sign up for the weit list and we're going to go ahead and just paste this in full code and so we're going to generate that and here is our final site if we click join the wait list we get this pop up down here at the bottom and sign up for Early Access I can type in Riley um job title a wizard and we can submit it and let us know what you're excited to use this hi submit and there you go we generated this very quickly on vzer I'm pretty sure you get like Generations on v0 per day for free anyway thanks for watching subscribe I love you I'll see you here in the next video
